DETAILED ACTION

Allowable Subject Matter

1. An "Amendment" was received on March 18, 2004, in response to Office Action of September 16, 2003. Independent claims 1, 16, 20 and 23 have been amended, as indicated.

2. Claims 1-25 are allowed.

3. The following is an examiner's statement of reasons for allowance:

With respect to amended independent claims 1, 16, 20 and 23, prior art fails to disclose a method or apparatus of a charged particle beam (CPB) comprising: a CPB source for directing a beam along a path in a downstream direction to a target, a processing station that defines a target chamber, a chamber divider which divides the target chamber into upstream and downstream regions curing CBP processing of the target located in the downstream region; and an aperture formed in the chamber divider and sized and positioned along the beam to the target without substantial blockage and to limit backflow of gas to the upstream region. Prior art further fails to disclose an ion implanter comprising an ion source, mass analyzer, an accelerator, a scanner, a processing station at a target chamber, a divider which divides the target chamber into upstream and downstream regions, sized and positioned along the beam path to permit passage of the ion beam to the target without substantial blockage and to limit backflow of gas into the upstream region of the chamber.

In the prior art, efforts have been made to compensate for inaccuracies in ion beam measurements resulting from beam alteration attributed to introduction of extraneous species from various sources. Such efforts rely on sensing the residual background gas, and then adjusting the ion dose according to a calibration model based upon the probability of charge altering collisions occurring under the conditions of operation. Calibration, however, is difficult, as the calibration model may not accurately reflect the operating conditions. Variable and movable apertures have been used in the prior art, but have been unsatisfactory in resolving the problems, which arise when gas is liberated from photoresist-coated wafers during ion implantation.

The present invention is directed to an ion implanter apparatus, which minimizes the effects on the ion beam of extraneous gases released into the target chamber as a result of beam impingement on target wafers. In particular, the invention involves dividing the target chamber into upstream and downstream regions with a divider having an aperture for passage of the beam to the target. The aperture size is adjusted to let substantially most of the beam through but to significantly limit gas flow from the target to the upstream side of the divider. Preferably, the aperture size is adjustable for different beam configurations and is located close to the target, which may comprise one or more movable plates and a drive mechanism for moving the plates toward or away from each other to adjust the aperture size. According to a further aspect of the invention, a method is provided for reducing the probability of beam-altering collisions within a target chamber of an ion implanter. The target chamber is adapted for enclosing a target having photoresist. The method comprises providing a divider within

the target chamber, which divides the target chamber into upstream and downstream regions during ion beam processing of the target. The target is located within the downstream region, and the chamber divider has an aperture sized to permit passage of the ion beam to the target without substantial blockage and to limit backflow of gas into upstream region of the chamber.

Claims 2-15, 17-19, 21-22 and 24-25 are allowed by virtue of their dependencies on the independent claims 1, 16, 20 and 23.

Conclusion

4. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments of Statement of Reasons for Allowance".
